## Field trial

2022

The collected seeds of Brassica accessions were sown in the field at the end of the March

Unfavorable environmental conditions severely affected growth and development of the accessions

Only several plants from accessions number 20 (*Raphanus raphanistrum*), 22 (*Synapis arvensis*) and 23 (*Synapis arvensis*) germinated and grown to flower.

Probably due to severe drought the low amount of seed was produced, but it was not viable.

2022

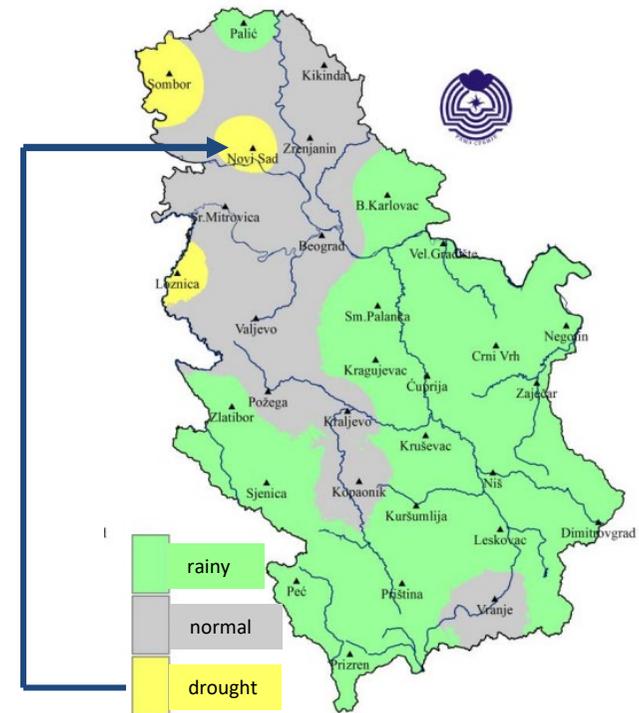

More wild Brassicas collected

Seeds from eight species: *Isatis tinctoria*, *Raphanus raphanistrum*, *Lunaria annua*, *Alyssoides utriculata*, *Alyssum orientale*, *Sinapis arvensis*, *Aurinia corymbosa*, *Aurinia saxatilis* were collected

2023

Struggles with growing wild *Brassicac*s in field conditions

Meteorological conditions were quite unusual  
warmer temperatures and  
much higher precipitation.

2023

Limited soil drainage and excess soil moisture, low soil fertility (low content of organic matter), unfavorable soil properties (salinity, high clay content), bad conditions for rooting

The crop was hit by two high-intensity storms on 19 July and 21 July

# Mitigating risks in cultivating wild Brassicas

## Low germination rate

- Difficulty in achieving optimal germination of wild brassica seeds.
- Implications for overall crop yield and success.

## Direct sowing approach

- Challenges faced due to unpredictable environmental conditions affecting seed germination

## Severe drought stress

- Drought conditions led to increased stress on the plants.
- Negative effects on growth, development, and overall crop health

## Overcoming Challenges

- Germinating indoors in Petri dishes than container/biodegradable pot and than transplanting on field after risk of frost has passed
- Mulching: Applying organic or synthetic mulch to retain soil moisture
- Drip irrigation: efficient water delivery to plants, reducing stress during dry periods
- Regularly monitor weather forecasts to anticipate potential drought periods

# Collard greens *B. oleracea acephala*

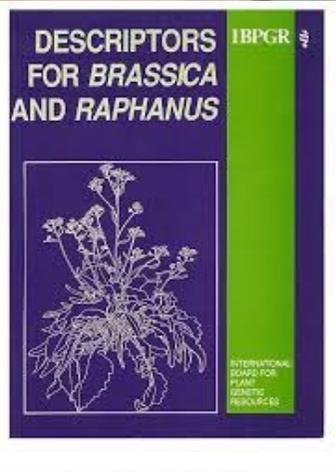

4 samples from 3 countries: Montenegro, Bosnia and Herzegovina, Croatia

8 samples from 6 locations in Vojvodina province, Serbia

Collard greens *B. oleracea acephala*

Characterization of collected populations

Green house – open field

Available seed upon request

## Assessment of molecular diversity of *Brassica oleracea* var. *acephala*

Family Brassicaceae is abundant in species used in food production, but also contains many industrial species, vegetables and ornamentals. Green collard (*Brassica oleracea* var. *acephala* L.) was traditionally grown in Balkan Peninsula and its wide green leaves, rich in vitamins A and C, are used for cooking. There is great diversity in *B. oleracea* *acephala* germplasm that reflects on agronomic, morphological and molecular characteristics.

### Material & Methods

32 SSRs to assess genetic variation of 38 accessions of green collard (3 commercial varieties, 35 locally grown populations) collected in Western Balkan: 18 from Bosnia and Herzegovina, 8 from Serbia (Vojvodina), 7 from Croatia and two from Montenegro

### Results

High level of overall genetic diversity between/within accessions and commercial varieties ( $H_e > 0.81$ ) due to highly polymorphic SSR markers ( $PI > 0.86$ ) applied for allele genotyping.

Accession	PC	H <sub>e</sub>

# First conference about medicinal and wildgrowing edible plants Pirot, Serbia, July 12 - 14. 2021.

- Oral presentation
- Scientific board
- Programme board

## Medicinal plants from Brassicaceae family - black and white mustard

Dragana Rajković<sup>1\*</sup>, Ana Marjanović Jeromela<sup>1</sup>

## ЕТНОБОТАНИКА ETHNOBOTANY

Прво саветовање о лековитом и самониклом јестивом биљу  
First conference about medicinal and wild-growing edible plants

Зборник резимеа  
Book of abstracts

## Carinata and camelina boosting the sustainable diversification in agricultural production systems

Portfolio of innovative crop diversification solutions including two promising easy-to-grow oilseed crops: carinata (*Brassica carinata* L. Brown) and camelina (*Camelina sativa* L. Crantz)

WP2 - valorisation of the carinata and camelina feedstocks i.e. oil, meal and co-products derived from camelina and carinata

New biobased products: convert erucic acid of carinata into brassilic and pelargonic acid from which obtaining a number of biodegradable products (brassilic acid) such as mulch films, pots, clips, and pheromone supports, new biopolymers, biodegradable bio-herbicides

Funded by  
the European Union

## Marginal agricultural land and climate-resilient and biodiversity-friendly industrial crops for innovative bio-based value chains

Sustainable biomass production on marginal lands - Applying innovative low ILUC cropping systems on selected non edible (industrial): oilseeds, fibres, dryland shrubs, woody species

Bio-based products: biochemicals, biomaterials, elastomers

Sustainable bio-based value chains - Biodiversity restoration potential

Funded by  
the European Union

Center of Excellence for  
Innovations in Breeding  
of Climate Resilient Crops
